

Un O-ring è un anello di elastomero a sezione circolare usato come guarnizione meccanica o sigillo.

Sono progettati per essere inseriti in appositi alloggiamenti ed essere compressi durante l'assemblaggio di due o più parti, creando così una guarnizione.

L'unione può essere statica o, talvolta, consentire piccoli movimenti tra le parti dell'o-ring.

Le giunture in movimento richiedono spesso un'adeguata lubrificazione per ridurre l'attrito.

Gli o-ring sono una guarnizione piuttosto comune, usati nei progetti per via dei loro costi limitati e della loro resistenza a decine di megapascal di pressione.

Il brevetto statunitense dell'o-ring venne registrato nel 1937 dal settantaduenne danese Niels Christensen[1], un tornitore giunto in America nel 1891 che registrò anche il brevetto di un freno ad aria per i tram.

Nonostante i suoi sforzi legali la sua proprietà intellettuale passò da una compagnia all'altra fino alla Westinghouse.

Durante la Seconda guerra mondiale il governo statunitense dichiarò l'o-ring fondamentale per la guerra, consentendone la produzione ad altre compagnie.

Christensen ricevette un pagamento di 75.000 \$ e, dopo la sua morte e molte cause legali, un ulteriore risarcimento di 100.000 \$ ai suoi discendenti.

ELASTOMERO:

- Gomma Fluorurata FPM, Nomi commerciali: VITON da Du Pont, TECHNOFLON da Montedison, FLUOREL da 3M).

- Possiede un'ottima resistenza chimica ed è raccomandata per applicazioni a temperature elevate.

- Temperatura di impiego: -30 + +200 °C.

- Colore standard: NERO.
