

Un O-ring è un anello di elastomero a sezione circolare usato come guarnizione meccanica o sigillo.

Sono progettati per essere inseriti in appositi alloggiamenti ed essere compressi durante l'assemblaggio di due o più parti, creando così una guarnizione.

L'unione può essere statica o, talvolta, consentire piccoli movimenti tra le parti dell'o-ring.

Le giunture in movimento richiedono spesso un'adeguata lubrificazione per ridurre l'attrito.

Gli o-ring sono una guarnizione piuttosto comune, usati nei progetti per via dei loro costi limitati e della loro resistenza a decine di megapascal di pressione.

Il brevetto statunitense dell'o-ring venne registrato nel 1937 dal settantaduenne danese Niels Christensen[1], un tornitore giunto in America nel 1891 che registrò anche il brevetto di un freno ad aria per i tram.

Nonostante i suoi sforzi legali la sua proprietà intellettuale passò da una compagnia all'altra fino alla Westinghouse.

Durante la Seconda guerra mondiale il governo statunitense dichiarò l'o-ring fondamentale per la guerra, consentendone la produzione ad altre compagnie.

Christensen ricevette un pagamento di 75.000 \$ e, dopo la sua morte e molte cause legali, un ulteriore risarcimento di 100.000 \$ ai suoi discendenti.

#### ELASTOMERO:

- Gomma Nitrilica NBR (copolimero di butadiene e acrilonitrile).
- Utilizzato per la maggior parte delle applicazioni di tenuta per fluidi convenzionali.
- Temperatura di esercizio: -30 + +100 °C.
- Colore standard:NERO.
